Digital Literacy Project Report

NAME-Pratham Yadav

REG No.-25BAI11032

Course Code- CSE0001

Course Title-Digital Literacy

Program-B.Tech CSE (AI & ML)

University-VIT BHOPAL

Introduction

This report has been prepared for the CSE0001 Digital Literacy portfolio. The portfolio demonstrates practical understanding of digital literacy through visual communication, online identity building, coding platform engagement, email etiquette, and cyber safety awareness.

Digital literacy is not limited to knowing how to use devices or applications. It also includes the ability to communicate responsibly, evaluate information, maintain a professional digital presence, and stay safe while using online services. It is an essential skill for students because academic work, professional networking, collaboration, and financial transactions now happen through digital platforms every day. This project helped me understand that digital literacy is not limited to knowing how to use devices or apps. It also includes presenting oneself professionally online, communicating respectfully, verifying information, protecting personal data, and staying safe from cyber threats. Through the five tasks in this project, I worked on visual communication, digital portfolio building, coding-platform participation, email etiquette, and cybercrime awareness. Each module gave me practical experience with tools and habits that are useful not only for coursework but also for internships and long-term career development. This report documents the work completed in each module and reflects on what I learned from the activities.

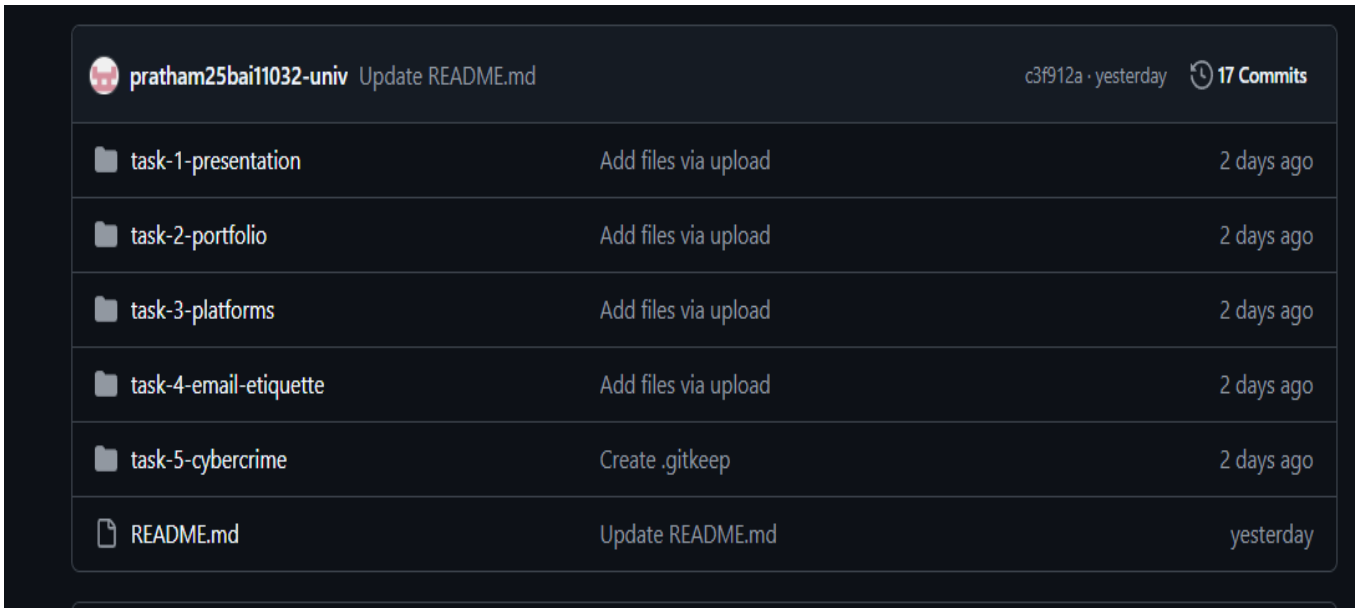
Objectives of the Portfolio:

The main objectives of this portfolio are:

- To understand the meaning and importance of digit al literacy in academic and professional life.
- To develop awareness of safe and responsible online behaviour.
- To build a basic professional digital presence using relevant online platforms.
- To practice formal and respectful communication in digital environments.
- To improve awareness of cybercrime risks and methods of prevention.

Evidence Summary

Task	Evidence File	Purpose
Task 1	Digital_literacy/task1/Digital Literacy.png	Visual awareness poster on digital literacy and safe internet use
Task 2	Digital_literacy/task2/Github profile.png, Digital_literacy/task2/keggle profile.png, Digital_literacy/task2/Stackoverflow profile.png	Screenshots of digital portfolio and online professional identity
Task 3	Digital_literacy/task3/Hackerank.png, Digital_literacy/task3/GOOGLE FORM.png, Digital_literacy/task3/SPREADSHEET.png	Evidence of participation on a coding and problem-solving platform
Task 4	Digital_literacy/task4/Email_ettiquite.pdf, Digital_literacy/task4/5 do and dont.pdf	Professional communication and online etiquette materials
Task 5	Digital_literacy/task5/casestudy.md, Digital_literacy/task5/prevention-checklist.md	Cybercrime case study and practical safety checklist



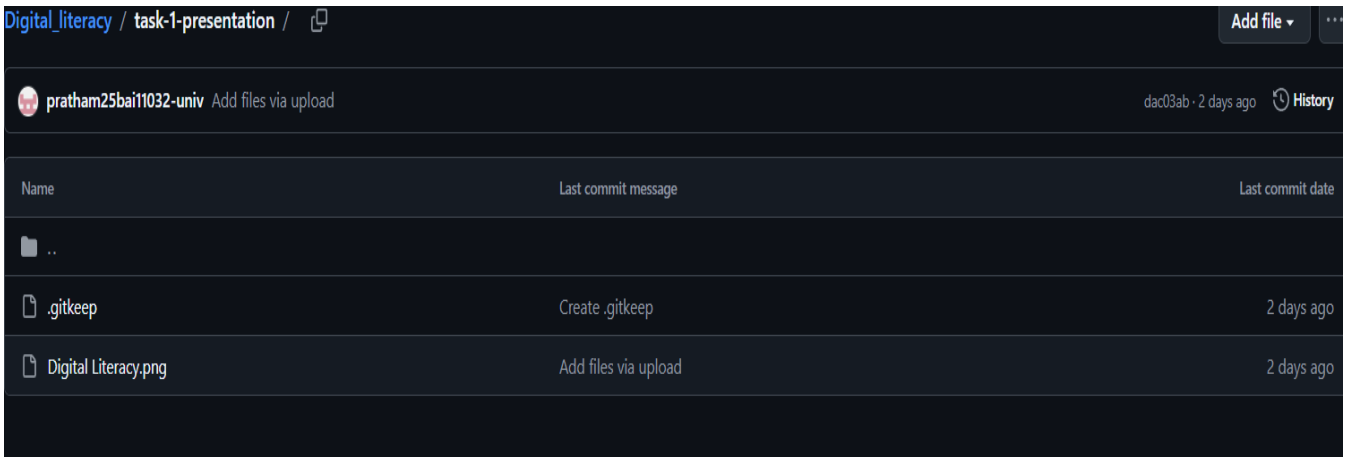
Task-Wise Report

Task 1: Digital Literacy Awareness Poster

The first task presents digital literacy in the form of a poster titled "Digital Literacy: Your Guide to Navigating the Online World." The poster explains digital literacy as the ability to find, evaluate, create, and communicate information using digital technologies. It also highlights useful digital tools for students and basic safe internet practices.

This task is effective because it simplifies a broad concept into a visually engaging format. The poster emphasizes three important safety habits: using strong passwords, thinking before clicking, and protecting privacy. These are core principles of digital literacy because they connect knowledge with responsible action.

From an academic perspective, the poster shows an understanding that digital literacy includes both productivity and online safety. It is not only about using apps or platforms, but also about making smart decisions while interacting online.



Task 2: Student Digital Portfolio

The second task focuses on building a digital identity across professional and learning-oriented platforms. The portfolio includes screenshots of GitHub, Kaggle, and Stack Overflow profiles. These platforms are valuable because they help students present their skills, interests, and learning progress publicly.

The GitHub profile screenshot shows an introductory README with personal details, academic background, and learning goals. This helps establish a professional online presence and makes the profile useful beyond course submission. Kaggle and Stack Overflow further represent participation in technical communities centered on data, coding, problem solving, and peer learning.

This task demonstrates that digital literacy also involves online professionalism. A student's digital footprint increasingly matters for internships, collaboration, and career opportunities. Maintaining meaningful profiles on trusted platforms is therefore an important practical skill.

Task 3: Coding and Collaboration Platform Engagement

The third task provides evidence of activity on HackerRank. The screenshot shows a successful coding challenge submission, confirming engagement with a platform used for technical practice and skill assessment.

This task is significant because coding platforms support self-learning, logical thinking, and digital confidence. They also introduce students to environments commonly used in technical interviews and skill benchmarking. By using such a platform, the student demonstrates the ability to work within structured digital systems, interpret outputs, and validate problem-solving performance.

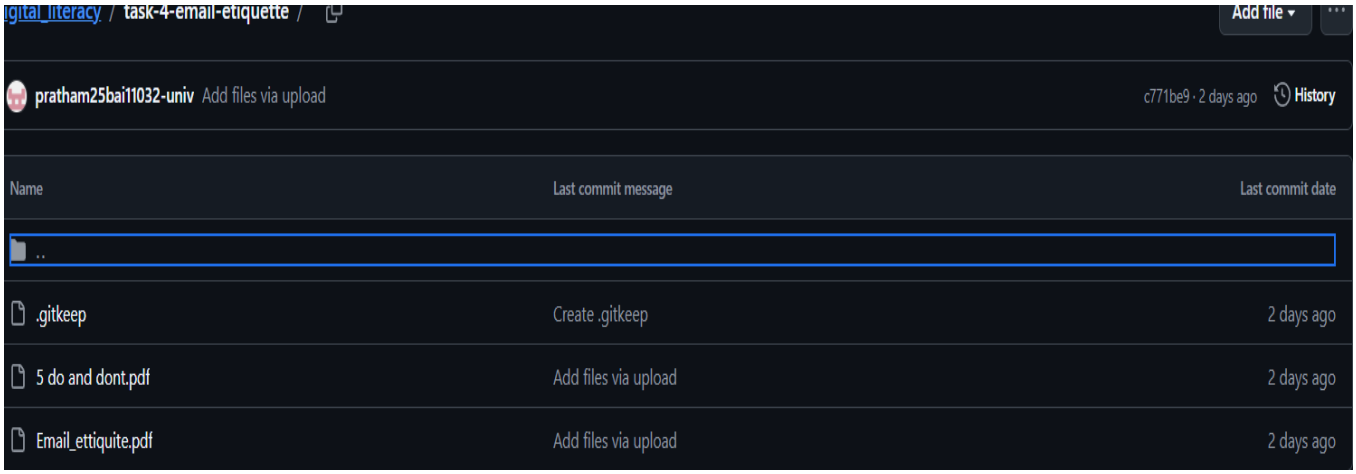
In the wider context of digital literacy, this task reflects active rather than passive technology use. It shows participation in a digital ecosystem where problem solving, feedback, and improvement are all mediated through online tools.

Task 4: Professional Email and Online Etiquette

The fourth task includes two PDF documents related to email etiquette and online conduct. These materials support one of the most important areas of digital literacy: communication. Knowing how to write professional emails and behave respectfully online is essential in academic, workplace, and collaborative settings.

Professional email etiquette helps students learn how to structure messages clearly, maintain a formal tone, and communicate respectfully with faculty, peers, and organizations. The do's and don'ts document extends this idea into general digital behaviour by promoting courtesy, responsibility, and awareness of public conduct online.

This task is valuable because digital communication leaves records and strongly shapes professional image. A student may have technical ability, but without proper communication habits, their digital presence may appear careless or unprofessional. This section of the portfolio therefore addresses the behavioural side of digital literacy.

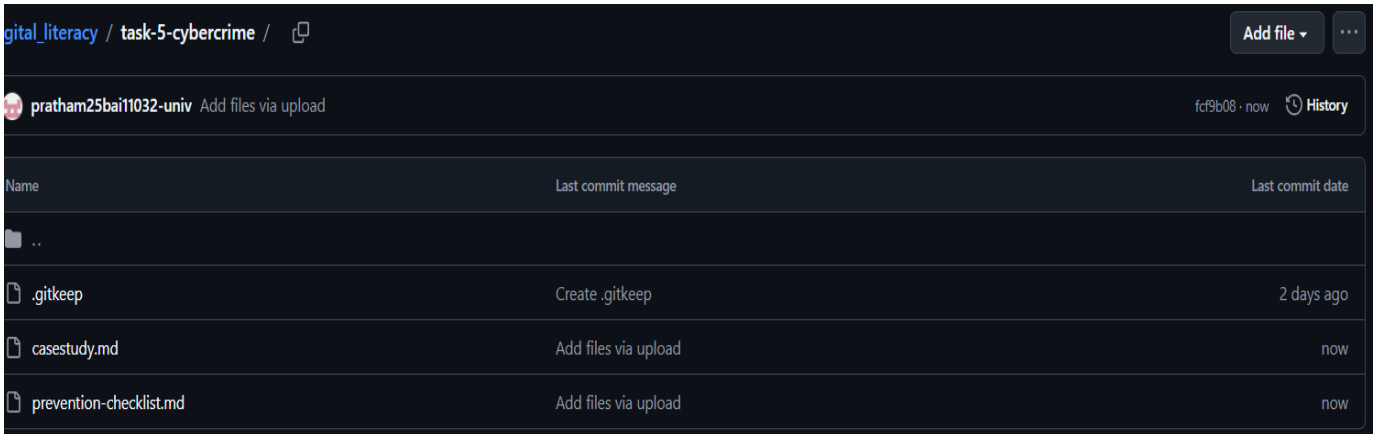


Task 5: Cybercrime Awareness

The fifth task is the strongest reflective component of the portfolio. It includes a case study on UPI and online payment fraud and a prevention checklist for college students in India. The case study explains how social engineering can trick users into authorizing fraudulent payments even when the technology itself is legitimate.

The example of UPI collect-request fraud is highly relevant because students regularly use payment apps for daily transactions. The write-up clearly explains a key safety rule: a user never needs to enter a UPI PIN to receive money. This single concept addresses one of the most common financial fraud patterns affecting young users.

The prevention checklist expands the discussion into practical digital safety habits. It covers strong passwords, two-factor authentication, public Wi-Fi caution, app permissions, phishing awareness, social media privacy, and cybercrime reporting channels such as 1930 and cybercrime.gov.in. This section shows that digital literacy includes awareness, prevention, and response.



Key Learning Outcomes

From the collected work, the following learning outcomes are evident:

- Digital literacy combines technical use, communication skills, critical thinking, and online safety.
- A professional digital identity can be developed through platforms such as GitHub, Kaggle, and Stack Overflow.
- Coding platforms like HackerRank help students build confidence and demonstrate measurable engagement with technology.
- Proper email writing and online etiquette are essential parts of academic and professional life.
- Cyber safety depends heavily on awareness of scams, cautious decision-making, and prompt reporting of incidents.

Overall Reflection

This portfolio shows a balanced approach to digital literacy. It does not focus only on technical tools, and it does not treat online safety as an isolated topic. Instead, it connects awareness, identity, communication, and cyber responsibility in a practical student context.

The strongest aspect of the portfolio is its relevance to student life. The tasks are grounded in real situations such as creating online profiles, solving coding problems, writing formal emails, and avoiding payment fraud. This makes the portfolio more meaningful than a purely theoretical submission.

Another positive aspect is the use of multiple formats, including images, PDFs, and markdown documents. This demonstrates familiarity with different kinds of digital artifacts and portfolio organization. The repository structure also supports easy review of the work.

Conclusion

The Digital Literacy portfolio successfully demonstrates the core expectations of the CSE0001 course. Through five tasks, it shows understanding of digital awareness, professional identity, platform usage, communication etiquette, and cybercrime prevention. Together, these submissions reflect both practical digital competence and responsible online behaviour.

In conclusion, the portfolio provides clear evidence that digital literacy is an essential life skill for modern students. It supports academic success, personal safety, and professional growth, making it a foundational competency for higher education and future careers.
